

The Relay8 a RS232 or UPB driven 8 circuit relay module

For control applications demanding isolated, dry contacts.

The Relay8net responds to the same simple 3 byte command as it's irrigation brother, the Rain8net and assigned any one of 250 possible addresses.

Possible commands include:

- Turn on or off each relay individually
- Turn off all relays on a specific module
- Turn off all relays on all modules
- Get the current status of all relays
- Optional momentary mode from 1 second to 250 minute

Relay Specifications

- Each of the 8 independent relays is equipped with a form C contact that is brought out to two plug in, detachable terminal strips.
- 1A @24VDC resistive
- 1A @120VAC resistive
- Relay contacts are designed for low current applications as well as power switching.
